

## ABSTRACT

The present invention is a container for draining a liquid from a wet, tapered paintbrush so that the bristles do not deleteriously flair upon drying. The single-piece container includes a draining sleeve section and a catch pan section. The draining sleeve has an open upper sleeve end and an open or partially-open lower sleeve end. The panels of the draining sleeve form a wedge-shaped drainage channel therebetween, corresponding to the tapered shape of the bristle end of the paintbrush.
